SUMMARY

Backend engineer with 5+ years building production systems end-to-end, including a Go central limit order book and matching engine for a binary-asset market. Specializes in low-latency, high-throughput trading infrastructure - a Simulate→Persist→Apply matching pipeline making ledger/state divergence structurally impossible, Kafka-sharded services sustaining 3K-5K req/sec, and a Solana market-data pipeline benchmarked 80-120ms ahead of named competitors. Deep Go concurrency, distributed-systems, and observability experience under strict performance and reliability constraints.

TECH STACK

Languages: Go, Python, TypeScript / JavaScript, SQL, C# *(Unity, pre-2021)*
Concurrency & Performance: Go goroutines / channels / sync / atomics, lock-free hot paths, batching, partition-pinned Kafka consumers, backpressure, stateful consumer rebalance
Backend & Data: PostgreSQL, ClickHouse, Redis, Dragonfly, MySQL, MongoDB, Tiger Data / TimescaleDB, transactional outbox, double-entry ledger, CLOB / matching-engine design
Messaging & RPC: Kafka (co-partitioned topics, partition-pinned ownership), gRPC (Helius Yellowstone server-streaming), Protobuf, REST, WebSocket
DevOps & Observability: Docker, Kubernetes (autoscaling tied to Kafka partition ownership), GitHub Actions CI/CD, Caddy, Nginx, Grafana, Prometheus, Sentry
Trading / Markets: Order book & matching engine, order execution (market / limit), settlement & double-entry ledger, real-time market-data ingestion, trading-terminal infrastructure (three shipped)

WORK EXPERIENCE

Backend Engineer, Trading Infrastructure - Distribute AI *(Remote, San Francisco USA)* *October 2025 - May 2026*

- **Architected** a Go central limit order book and matching engine for a binary-asset prediction market on a Simulate→Persist→Apply pipeline - committing order reservations, fill events, and outbox rows in a single Postgres transaction before any in-memory state mutates, making ledger/state divergence structurally impossible.
- **Scaled** the matching engine across 8 Kubernetes pods and 64 shards via co-partitioned Kafka topics with partition-pinned ownership keyed by book ID; benchmarked at 3K-5K req/sec sustained with 5-10× burst absorption, hardened with OnRevoked snapshot-and-evict consumer-rebalance semantics.
- **Engineered** a double-entry settlement ledger with four settlement paths plus a transactional outbox and drainer for coordination-free publishing - bulk COPY FROM writes collapsing per-trade I/O into a fixed, small number of statements and decoupling write-path availability from Kafka.
- **Built** Radar, a high-throughput market-data ingestion service consuming the Helius Yellowstone gRPC Geyser server-streaming subscription and decoding Protobuf-encoded on-chain messages for real-time Solana events - custom parsing algorithm benchmarked 80-120ms ahead of Axiom and Padre (competitors' trading terminals) in head-to-head latency tests, tuned for sub-100ms ingestion-to-render.
- **Shipped** the trading terminal end-to-end - Go backend for order execution, wallet management, and partner-facing REST APIs over a four-service data plane (parse / persist / reconcile / enrich), with a React + TradingView + WebSocket frontend; stood up Grafana / Prometheus / Sentry observability across all services.

Backend Engineer - Trading Terminal - Vyper *(Acquired by Pump.fun · Remote, California USA)* *December 2024 - October 2025*

- **Built** the core data infrastructure for Vyper Terminal - a Solana trading terminal shipped publicly in production, generating four figures in daily revenue at peak before acquisition - with real-time social and on-chain pipelines averaging 300ms catch time at 5M req/hour, persisting Telegram/Twitter monitoring data to MongoDB alongside a MySQL relational store.
- **Reverse-engineered** Cloudflare-protected Solscan endpoints into a proprietary internal API wrapper sustaining tens of thousands of requests/hour for live terminal market data, backed by a CDP browser fleet auto-scaling instance count to request load.
- **Engineered** Telegram and Discord monitoring services with real-time event delivery and a full API layer over the Telegram client protocol - customers imported their own owned channels, surfacing keyword/message signals into the terminal's sniper module.
- **Shipped** a multi-page Telegram trading bot (beta) with market and limit order execution, wallet management, token sniping, and full PnL reporting via on-the-fly image generation.

Software Engineer - AIY Experts Solutions *(Tripoli, Lebanon)* *January 2021 - December 2024*

- **Optimized** a core task engine to sustain 20K+ concurrent automation tasks per instance under heavy contention with minimal latency degradation, via worker / main-process isolation and targeted profiling.
- **Engineered** sub-second checkout automation across Amazon, Best Buy, Target, Shopify, and 10+ platforms, sustaining low-hundreds-of-milliseconds latencies against actively-defended adversarial targets.
- **Reverse-engineered** JavaScript-obfuscated anti-bot values, 2FA, login, and queue systems at the protocol level; owned hiring, technical direction, and delivery for a 4-person team as Technical Project Owner.

NOTABLE PROJECTS

TridentKit - Founded, scaled, and exited (cash acquisition, December 2024) a full Ethereum/Uniswap trading terminal - an Electron + React + TypeScript desktop client with TradingView charts, a live order book, market and limit order entry, and integrated wallet management; six figures in revenue and $500K+ in user profits over 2.5 years. Built a modular backend task engine running tens of thousands of concurrent tasks per instance with worker/main-process RPC isolation, plus automated CI/CD for cross-platform Electron releases via GitHub Actions.
Horus - Co-founder of a full-stack automation platform; scaled scraping to tens of thousands of items/hour at 98% success rate, tuned Postgres via targeted indexing through Prisma, owned end-to-end deployment (Nginx, DNS, hosting). Soft-launched, ~15 beta customers.

OPEN SOURCE

- **AutomatedScripting** - records browser interactions, maps network calls into an indexed request graph, LLM-generates runnable automation scripts.

- **FundedByV2** - Solscan API wrapper that auto-harvests Cloudflare cookies to bypass anti-bot protection.
- **NewsSniper** - Binance / Bybit listing monitor bypassing Cloudflare cache.
- **signature-scrape** - scraper for Ethereum mint-signature API endpoints.
